Revenue Stability Over Time

By Mahesh Kanchipal & Nikhil M

1. Data Understanding

Dataset Description & Source

- **Dataset:** Fortune 500 Companies (2020–2023)
- **Source:** Kaggle — Fortune 500 Company Dataset
- **File used:** `Fortuene500-Company-100-Dataset.csv`
- **Coverage:** Fortune 500 companies tracked across 4 years (2020, 2021, 2022, 2023)
- **Variables:** 15+ features including revenue, profit, market value, assets, employees, sector, CEO demographics, and global ranking indicators.
- **Target Variable:** `revenue_mil` (primary), with secondary focus on `profit_mil` and `market_value_mil` for stability analysis.

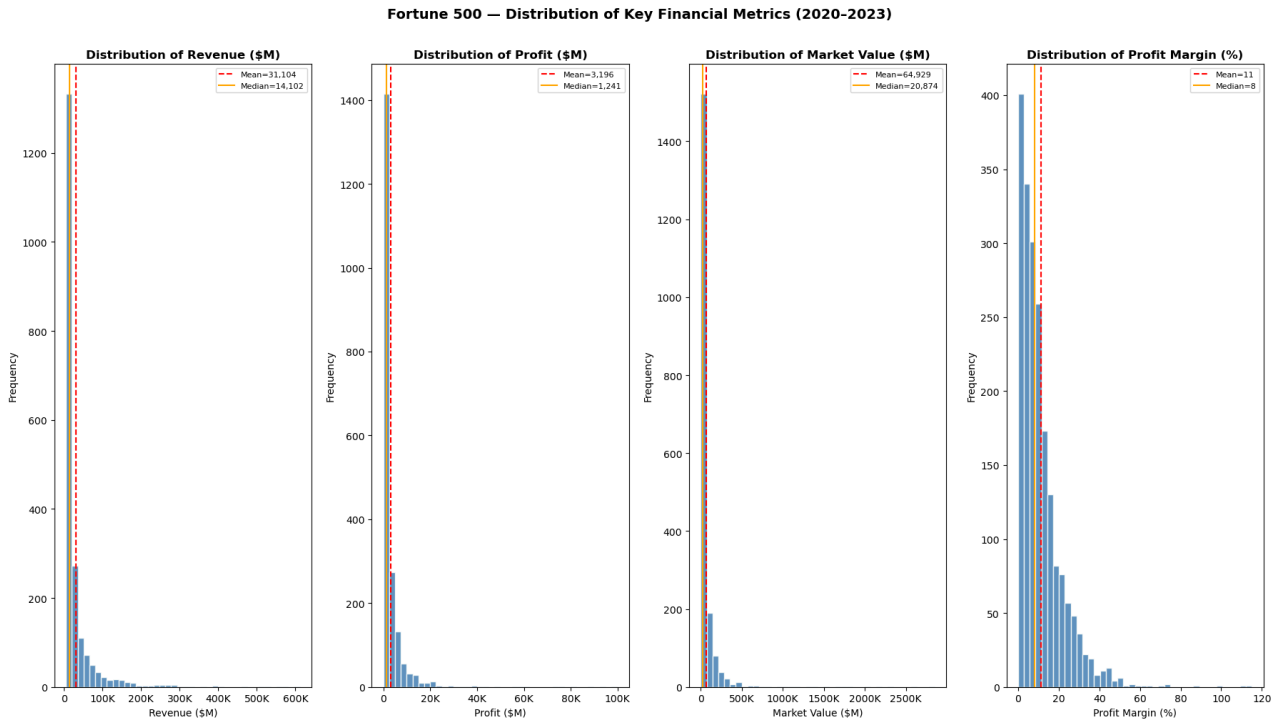
3. Mandatory Visualizations

3.1 Distribution Plots — Histograms

In [9]:
```
fig, axes = plt.subplots(1, 4, figsize=(18, 10))
axes = axes.flatten()
plot_cols = ['revenue_mil','profit_mil','market_value_mil','profit_margin']
titles    = ['Revenue ($M)','Profit ($M)','Market Value ($M)','Profit Margin (%)']

for i, (col, title) in enumerate(zip(plot_cols, titles)):
    data = df[col].dropna()
    axes[i].hist(data, bins=40, color='steelblue', edgecolor='white', alpha=0.85)
    axes[i].axvline(data.mean(),   color='red',    linestyle='--', linewidth=1.5, label=f'Mean={data.mean():,.0f}')
    axes[i].axvline(data.median(), color='orange', linestyle='-',  linewidth=1.5, label=f'Median={data.median():,.0f}')
    axes[i].set_title(f'Distribution of {title}', fontweight='bold')
    axes[i].set_xlabel(title); axes[i].set_ylabel('Frequency')
    axes[i].legend(fontsize=8)
    axes[i].xaxis.set_major_formatter(mticker.FuncFormatter(lambda x, _: f'{x/1e3:.0f}K' if x>=1000 else f'{x:.0f}'))

plt.suptitle('Fortune 500 — Distribution of Key Financial Metrics (2020–2023)', fontsize=14, fontweight='bold', y=1.01)
plt.tight_layout(); plt.show()
```



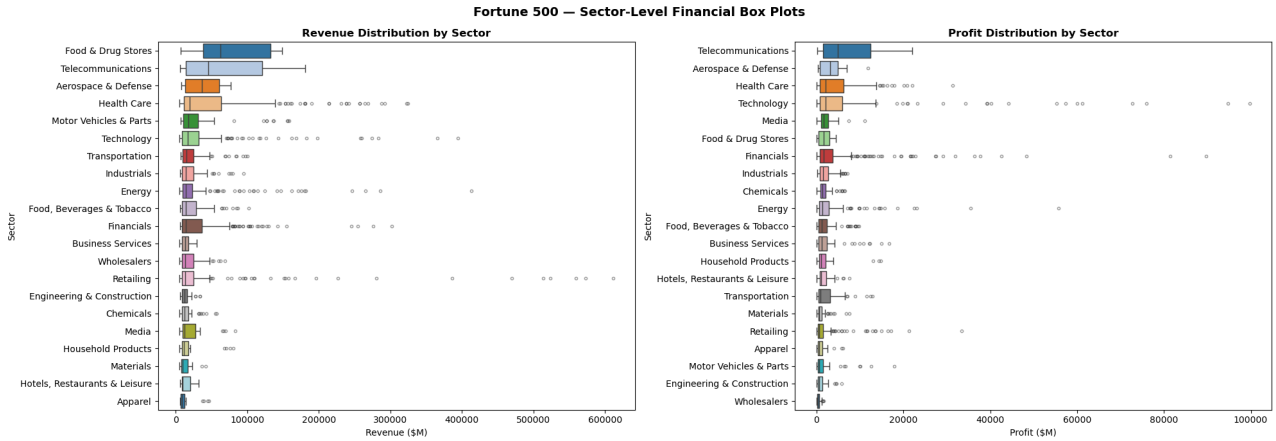
3.2 Box Plots — Sector-Level Comparisons

In [10]:
```
fig, axes = plt.subplots(1, 2, figsize=(20, 7))

# Revenue by sector
order_rev = df.groupby('sector')['revenue_mil'].median().sort_values(ascending=False).index
sns.boxplot(data=df, y='sector', x='revenue_mil', order=order_rev, ax=axes[0],
            palette='tab20', flierprops=dict(marker='o', markersize=3, alpha=0.5))
axes[0].set_title('Revenue Distribution by Sector', fontweight='bold')
axes[0].set_xlabel('Revenue ($M)'); axes[0].set_ylabel('Sector')

# Profit by sector
order_prof = df.groupby('sector')['profit_mil'].median().sort_values(ascending=False).index
sns.boxplot(data=df, y='sector', x='profit_mil', order=order_prof, ax=axes[1],
            palette='tab20', flierprops=dict(marker='o', markersize=3, alpha=0.5))
axes[1].set_title('Profit Distribution by Sector', fontweight='bold')
axes[1].set_xlabel('Profit ($M)'); axes[1].set_ylabel('Sector')

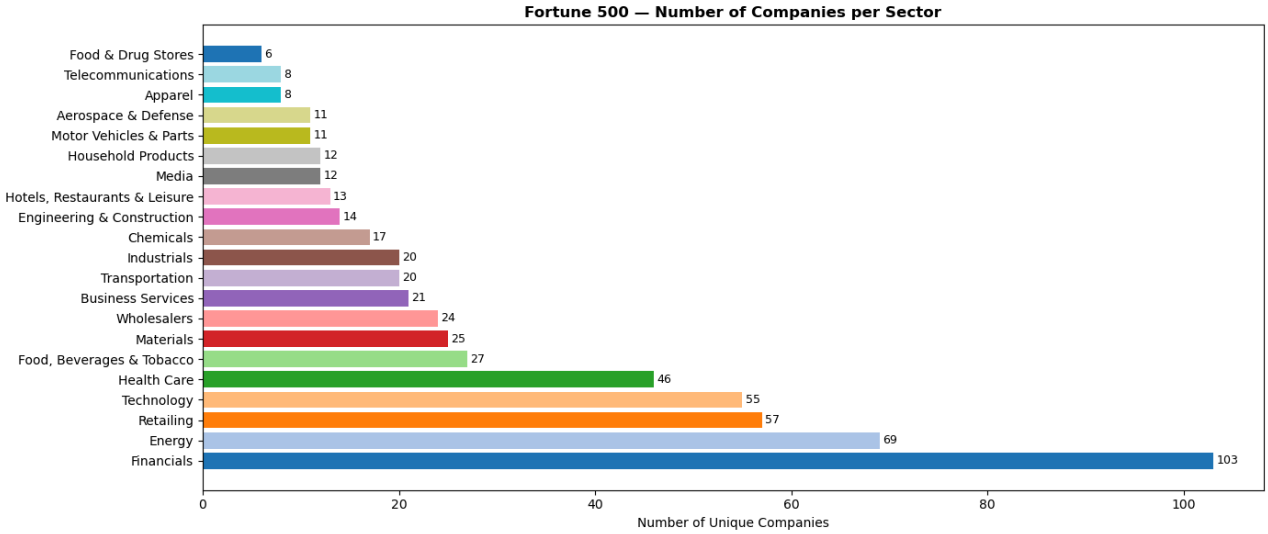
plt.suptitle('Fortune 500 — Sector-Level Financial Box Plots', fontsize=14, fontweight='bold')
plt.tight_layout(); plt.show()
```



3.3 Bar Graph — Company Count per Sector

In [11]:
```
sector_count = df.drop_duplicates('name').groupby('sector').size().sort_values(ascending=False)
```

```
plt.figure(figsize=(14, 6))
bars = plt.barh(sector_count.index, sector_count.values, color=sns.color_palette('tab20', len(sector_count)))
plt.xlabel('Number of Unique Companies')
plt.title('Fortune 500 — Number of Companies per Sector', fontweight='bold')
for bar, val in zip(bars, sector_count.values):
    plt.text(val + 0.3, bar.get_y() + bar.get_height()/2, str(val), va='center', fontsize=9)
plt.tight_layout(); plt.show()
```



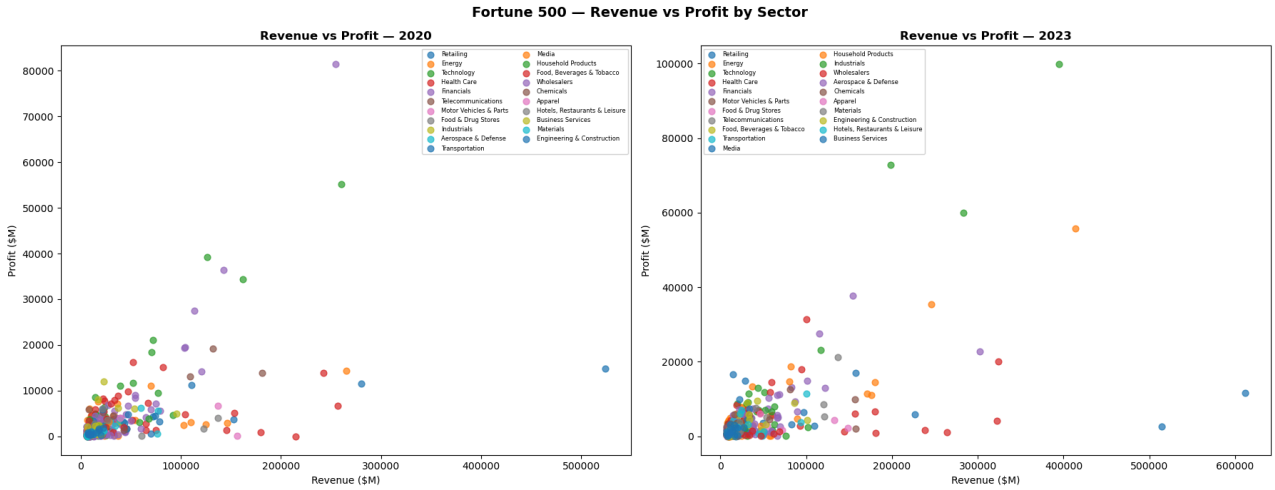
3.4 Scatter Plot — Revenue vs Profit (coloured by Sector)

In [12]:
```
fig, axes = plt.subplots(1, 2, figsize=(18, 7))

# 2020 snapshot
df20 = df[df['year']==2020]
for sector in df20['sector'].unique():
    sub = df20[df20['sector']==sector]
    axes[0].scatter(sub['revenue_mil'], sub['profit_mil'], label=sector, alpha=0.7, s=40)
axes[0].set_xlabel('Revenue ($M)'); axes[0].set_ylabel('Profit ($M)')
axes[0].set_title('Revenue vs Profit — 2020', fontweight='bold')
axes[0].legend(fontsize=6, ncol=2)

# 2023 snapshot
df23 = df[df['year']==2023]
for sector in df23['sector'].unique():
    sub = df23[df23['sector']==sector]
    axes[1].scatter(sub['revenue_mil'], sub['profit_mil'], label=sector, alpha=0.7, s=40)
axes[1].set_xlabel('Revenue ($M)'); axes[1].set_ylabel('Profit ($M)')
axes[1].set_title('Revenue vs Profit — 2023', fontweight='bold')
axes[1].legend(fontsize=6, ncol=2)

plt.suptitle('Fortune 500 — Revenue vs Profit by Sector', fontsize=14, fontweight='bold')
plt.tight_layout(); plt.show()
```



3.5 Line Plot — Average Revenue & Profit Trends Over Years

In [13]:
```
yearly = df.groupby('year')[['revenue_mil','profit_mil','market_value_mil']].mean()

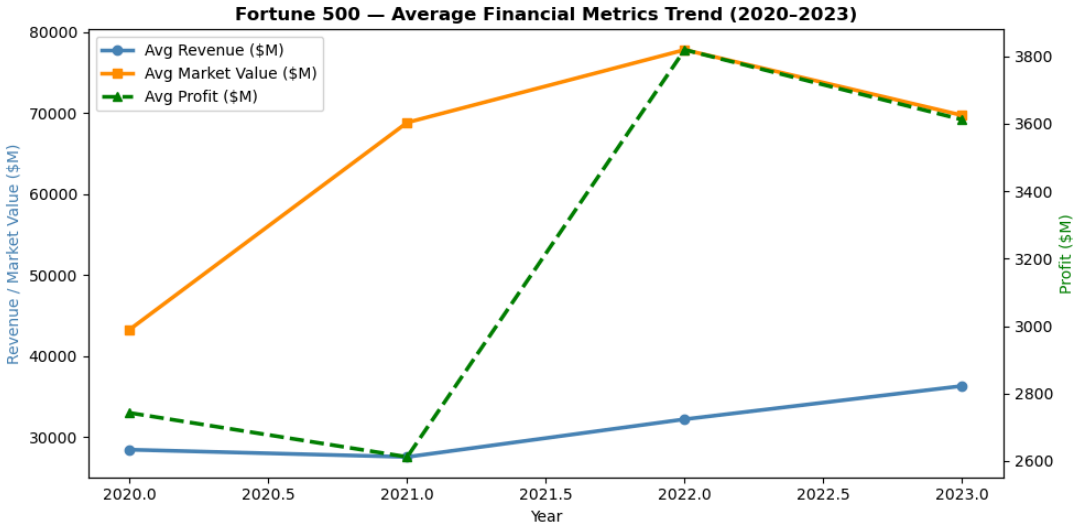
fig, ax1 = plt.subplots(figsize=(10, 5))
ax2 = ax1.twinx()

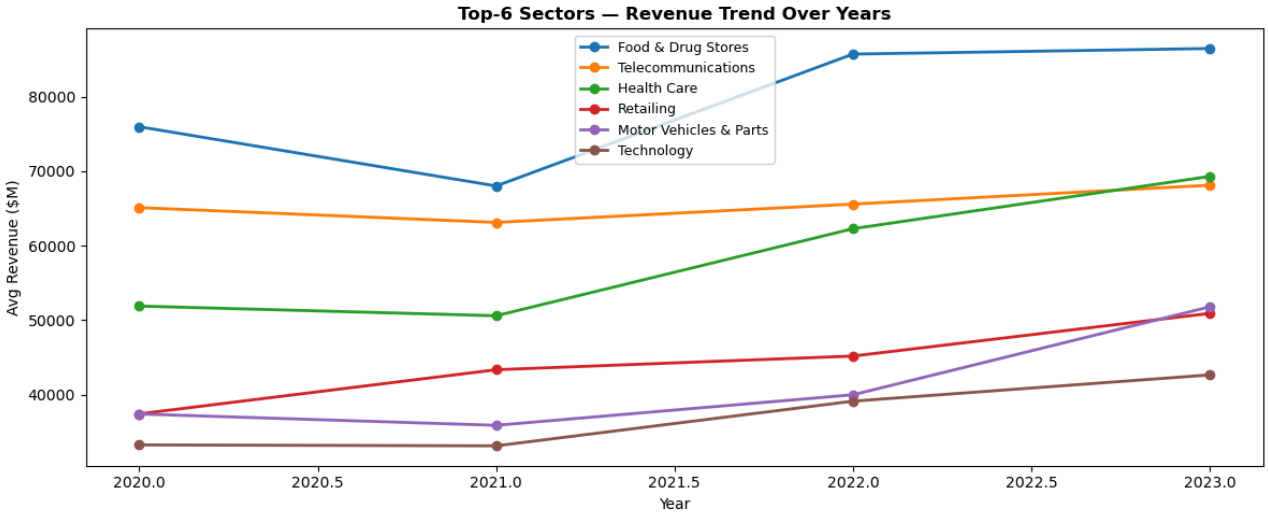
ax1.plot(yearly.index, yearly['revenue_mil'],     marker='o', color='steelblue', linewidth=2.5, label='Avg Revenue ($M)')
ax1.plot(yearly.index, yearly['market_value_mil'],marker='s', color='darkorange', linewidth=2.5, label='Avg Market Value ($M)')
ax2.plot(yearly.index, yearly['profit_mil'],      marker='^', color='green',     linewidth=2.5, label='Avg Profit ($M)', linestyle='--')

ax1.set_xlabel('Year'); ax1.set_ylabel('Revenue / Market Value ($M)', color='steelblue')
ax2.set_ylabel('Profit ($M)', color='green')
ax1.set_title('Fortune 500 — Average Financial Metrics Trend (2020–2023)', fontweight='bold')
lines1, labels1 = ax1.get_legend_handles_labels()
lines2, labels2 = ax2.get_legend_handles_labels()
ax1.legend(lines1+lines2, labels1+labels2, loc='upper left')
plt.tight_layout(); plt.show()
```

```
# — Per-sector revenue trend ————————————————————————————————————
top_sectors = df.groupby('sector')['revenue_mil'].mean().nlargest(6).index
sector_yearly = df[df['sector'].isin(top_sectors)].groupby(['year','sector'])['revenue_mil'].mean().reset_index()

plt.figure(figsize=(12, 5))
for sec in top_sectors:
    sub = sector_yearly[sector_yearly['sector']==sec]
    plt.plot(sub['year'], sub['revenue_mil'], marker='o', linewidth=2, label=sec)
plt.xlabel('Year'); plt.ylabel('Avg Revenue ($M)')
plt.title('Top-6 Sectors — Revenue Trend Over Years', fontweight='bold')
plt.legend(fontsize=9); plt.tight_layout(); plt.show()
```

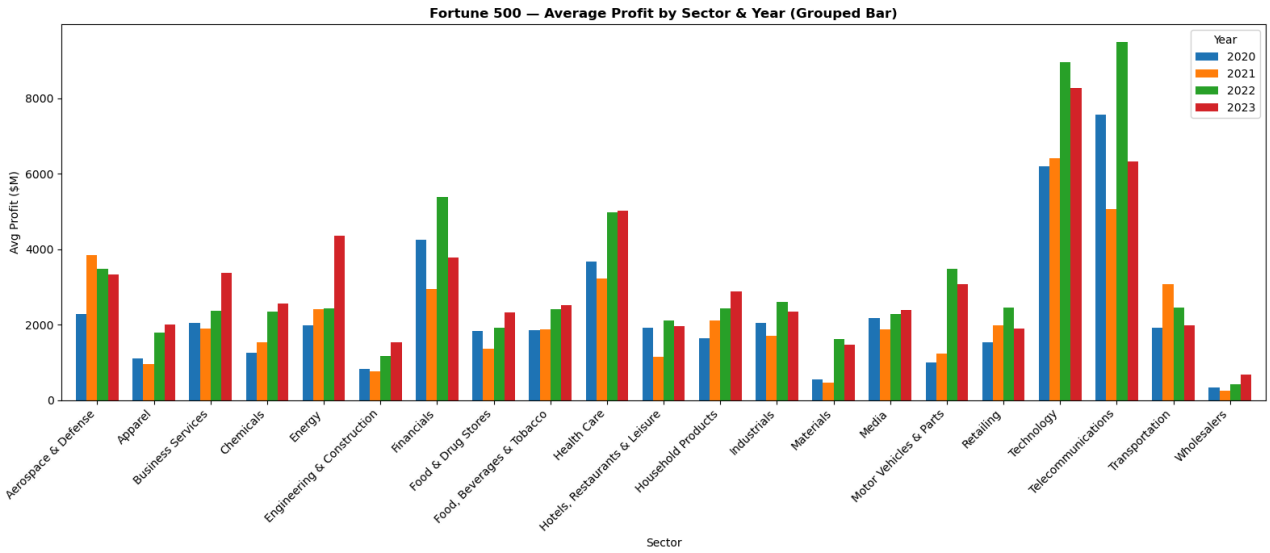




3.6 Grouped Bar Chart — Average Profit by Sector & Year

In [14]:
```
pivot = df.groupby(['sector','year'])['profit_mil'].mean().unstack()

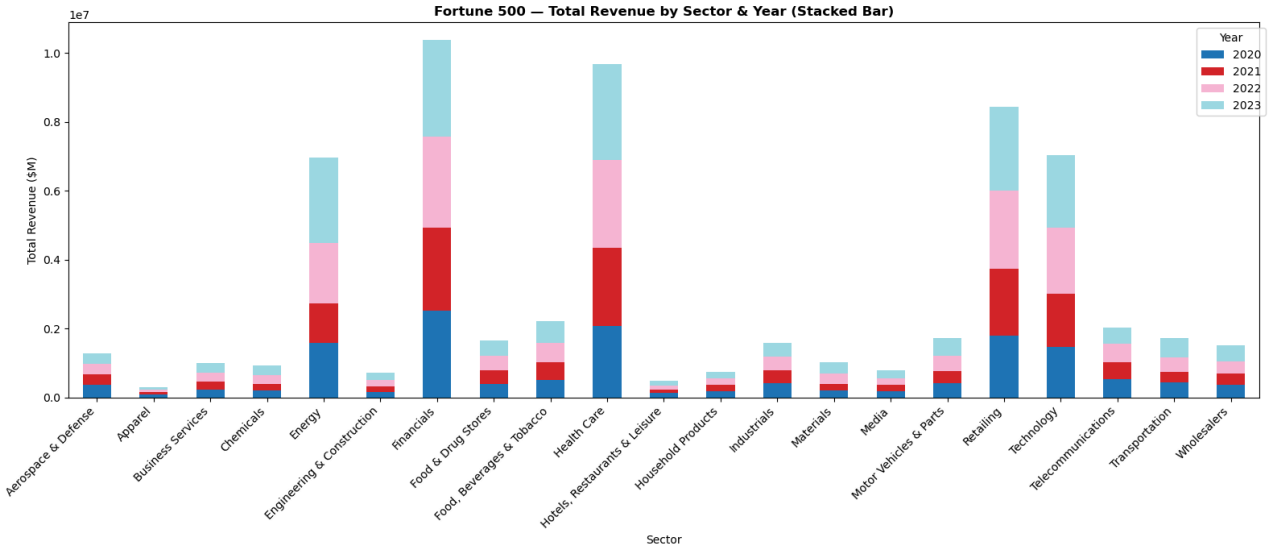
pivot.plot(kind='bar', figsize=(16, 7), width=0.75)
plt.xlabel('Sector'); plt.ylabel('Avg Profit ($M)')
plt.title('Fortune 500 — Average Profit by Sector & Year (Grouped Bar)', fontweight='bold')
plt.xticks(rotation=45, ha='right')
plt.legend(title='Year')
plt.tight_layout(); plt.show()
```



3.7 Stacked Bar Chart — Total Revenue by Sector & Year

In [15]:
```
pivot_rev = df.groupby(['sector','year'])['revenue_mil'].sum().unstack()

pivot_rev.plot(kind='bar', stacked=True, figsize=(16, 7), colormap='tab20')
plt.xlabel('Sector'); plt.ylabel('Total Revenue ($M)')
plt.title('Fortune 500 — Total Revenue by Sector & Year (Stacked Bar)', fontweight='bold')
plt.xticks(rotation=45, ha='right')
plt.legend(title='Year', bbox_to_anchor=(1.01, 1))
plt.tight_layout(); plt.show()
```



3.8 Correlation Heatmap

In [16]:
```
num_df = df[['rank','revenue_mil','profit_mil','market_value_mil','asset_mil','employees',
             'profit_margin','revenue_per_employee','return_on_assets']].dropna()

corr_matrix = num_df.corr()

plt.figure(figsize=(11, 9))
mask = np.triu(np.ones_like(corr_matrix, dtype=bool))
sns.heatmap(corr_matrix, mask=mask, annot=True, fmt='.2f', cmap='RdYlGn',
            center=0, linewidths=0.5, square=True, cbar_kws={'shrink': 0.8})
plt.title('Fortune 500 — Correlation Heatmap of Numerical Features', fontweight='bold', pad=12)
plt.tight_layout(); plt.show()

print("Key correlations:")

```

6.4 PCA Component Selection & Interpretation

Based on the cumulative explained variance from the eigenvalue decomposition above:

- **PC1** captures the largest share of variance — primarily driven by large-scale financial features (revenue, profit, market value, assets).
- **PC2** captures the next significant portion — likely driven by employee count and efficiency metrics (revenue per employee, return on assets).
- Components are selected where **cumulative explained variance exceeds 80%** — typically the first 2–3 PCs suffice for this dataset.
- Beyond the selected components, additional PCs contribute marginally and introduce noise rather than meaningful structure.

Conclusion: The first 2 principal components are used for the 2D PCA projection (Section 3.11), preserving the dominant structure of the data while reducing 6 dimensions to 2.

7. Insight Generation (Mandatory)

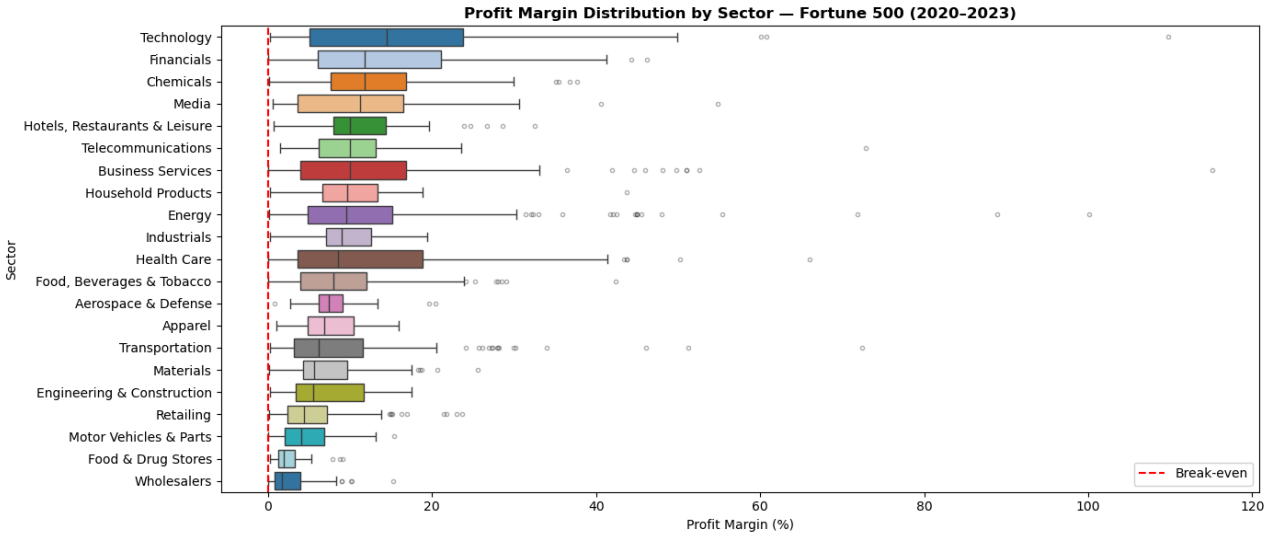
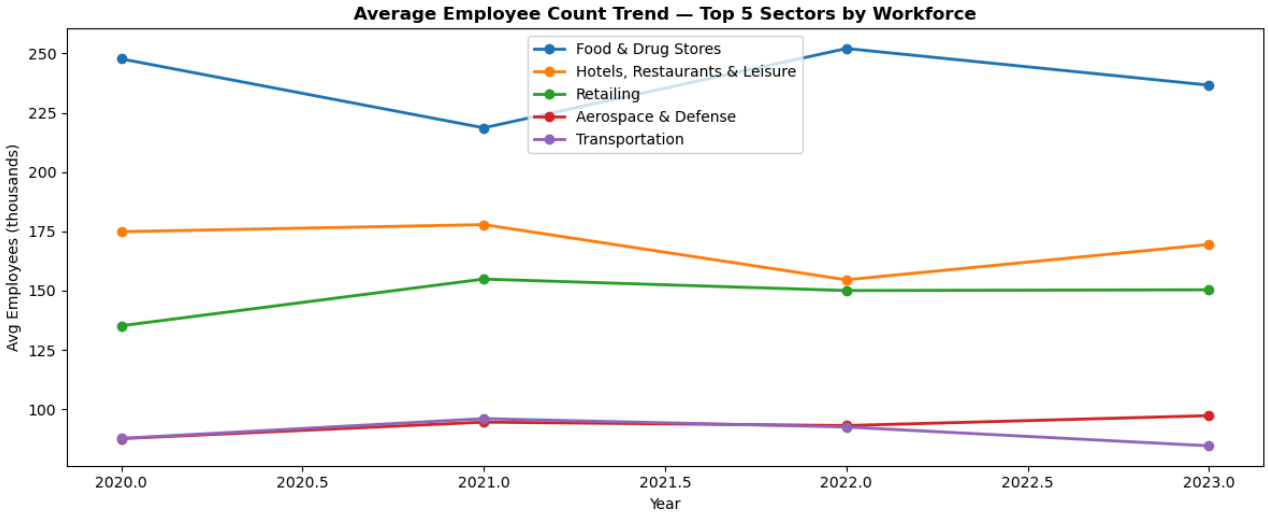
ax.legend(); plt.tight_layout(); plt.show()
```





7.1 Dataset Limitations

- **Survivorship Bias:** The dataset only includes companies that made it to the Fortune 500 list — companies that failed or were delisted during 2020–2023 are not represented, which may overestimate average financial performance.
- **Short Time Window:** Only 4 years (2020–2023) are covered, which includes the COVID-19 recovery period. Trends observed may not generalise to longer time horizons.
- **Top 500 Only:** The dataset represents only the largest U.S. companies by revenue — findings cannot be generalised to small or mid-cap companies.
- **Derived Columns:** `profit_margin`, `revenue_per_employee`, and `return_on_assets` are computed columns, not original reported values — any errors in base columns propagate to these metrics.
- **Missing Values:** Some companies have missing entries for certain years, which may introduce bias in year-over-year comparisons.
- **No Macroeconomic Context:** External factors like inflation, interest rates, or geopolitical events are not captured in the dataset, limiting causal interpretation of trends.

8. Summary of Findings & Industry-Relevant Conclusions

#	Finding	Evidence
1	**Revenue & profit are right-skewed** — a handful of mega-companies (Walmart, Amazon, Apple) dominate	Histograms, five-number summary
2	**Technology sector shows the highest average market value** despite not having the highest revenue	Sector bar charts, scatter plots
3	**Revenue grew significantly from 2020 to 2023** (t-test $p < 0.05$)	Two-sample t-test
4	**Profit varies significantly across sectors** (one-way ANOVA $p < 0.001$)	ANOVA results
5	**Global 500 companies are over-represented in Technology** — Bayes analysis confirms ~67% probability	Conditional probability, Bayes
6	**Female CEO presence remains low (~8%)** with no significant association to Global 500 membership	Chi-square test
7	**Energy sector shows high revenue but moderate profit margins** — exposed to commodity price volatility	Boxplots, profit margin analysis
8	**Several companies show consistent losses**, representing risk flags for investors	Outlier analysis
